

Net Deed Plotter Cheat Sheet

A quick field reference for plotting deeds in Greenbriar Net Deed Plotter. Get the software at deedplotter.com. To turn a legal description into these calls automatically, use the Deed Call Formatter at mccrackenlandservices.com.

1. Entering metes and bounds

Start at the first "thence" and enter one course per line. Net Deed Plotter reads a course as quadrant, degrees, a period, then minutes and seconds as four digits, the second quadrant, a space, and the distance.

```
North 22 degrees 13 minutes 10 seconds
East, 200.7 feet
N22.1310E 200.7 then press Enter
```

Minutes and seconds are always two digits each. Five minutes and three seconds is 0503, so a call could read S4.0503W 96.2. Pressing Enter drops the cursor to the next line.

2. Varas and feet

Older deeds often measure in varas instead of feet. Put a **V** at the end of the distance so the plot calculates acreage and scales correctly.

```
North 22 degrees 13 minutes 10 seconds
East, 200.7 varas
N22.1310E 200.7V then press Enter
```

If you leave the V off a vara call, the acreage and scale will be wrong. The Deed Call Formatter keeps the V for you.

3. Curves

A curve needs four pieces of data. Enter each when Net Deed Plotter asks:

- **Curve direction:** right or left.
- **Curve radius:** in feet or varas (a linear distance).
- **Arc length:** in feet or varas (a linear distance).
- **Central angle (delta):** in degrees, minutes, and seconds.

4. Changing the scale

- Press **F2** to view the map.
- Select **Scale** from the directory tree.
- The scale is in inches per feet. A 100 scale means one inch equals 100 feet.
- Smaller numbers make a larger map, larger numbers make a smaller map.

5. Coloring the map

- Press **F2** to view the map.
- Click inside the tract until it is outlined in green.
- Select **Fill** from the directory tree, then **Solid Color**.
- Use the same steps to hatch or checker the tract, then pick your color.

6. Changing the line color

- Press **F2** to view the map.
- Click inside the tract until it is outlined in green.
- Select **Lines** from the directory tree, then **Color**.

7. Deed calls on lines

- Press **F2** to view the map.
- Click inside the tract until it is outlined in green.
- Select **Map** from the directory tree, then **Deed Calls on Lines** to label each course on the plot.

Quick tip. Always read the whole description first and note the point of beginning, any ties, and any curves. Plot the courses, then confirm the tract closes back to the point of beginning before you trust the acreage.
